## Fixes

### Screen transfer speed on Vista

The screen transfer speed on Vista and 64 bit was very slow due to a collection of bugs. Some amelioration in the core graphic code has greatly enhanced the speed from this build onwards. Will also affect speed in terminal server sessions or other situations where bitmap transfer is used.

### Update of thumbnails

The quality of thumbnail updates as well as the speed is improved.

### Setting datapath in netop.ini

The file netop.ini may include information for the Teacher and Student on where to store its configuration data – often on a shared drive. Due to a bug this information was ignored in the previous and currently released build.

### Export of test results

If test results files contained double-byte characters (e.g. Japanese) the contents wouldn't be converted to the selected export format. Corrected

### Error concerning Rejoin of Student

An elusive error concerning rejoin of Students has been verified and corrected.

### Teacher crash in Video Chat

When starting AudioChat and starting Video or when starting A-V chat during demo, the Teacher module would crash. Fixed.

### New languages released – software only

Spanish and Portuguese are released as software only. Documentation in English.

### Stop workgroup

If more workgroups were started and you wanted to stop only a selected, all workgroups would be stopped. Now works correctly, enabling stop of any selected workgroup or all.

### Webupdate fails

The current version 2008295 cannot be updated to a newer version using webupdate. The error is corrected and from this build onwards webupdate will work.

## **Arabic Help files**

The current version 2008295 is missing Arabic help files or they are not formatted correctly. Both issues are fixed.

## **Blocking web sites using one word only**

There have been reports that defining a blocking policy using one word only – e.g. 'espn' instead of 'www.espn.com' – would fail to block. We have not been able to recreate the problem and at least this build release works correctly, blocking Internet Explorer, Firefox, and beta Google Chrome.
