

# INSTALL AND USE NETOP VISION IN A REMOTE DESKTOP SERVICES ENVIRONMENT

## NETOP® Vision™ Classroom Management Software

Netop Vision supports Microsoft Remote Desktop Services (formerly known as Terminal Services) environments.

This means that the Vision Student module can be installed and run on a central server and then be accessed by multiple students from almost any device that they use to connect to the server.

Netop Vision runs on the following server versions:

- Windows Server 2008 R2 with Remote Desktop Services
- Windows Server 2012 with Remote Desktop Services
- Windows Server 2012 R2 with Remote Desktop Services

The maximum number of simultaneously active instances of the student module is defined by hardware capabilities.

### **Install the Vision student module on the server**

Installing Vision on the Windows Server requires Administrator privileges.

Vision utilizes the Remote Desktop IP virtualization feature available in the newer Windows Server versions; IP virtualization means that every logon session on a Windows Server machine gets a distinct IP address.

When installing and configuring the Windows Server for the Vision student module, Remote Desktop IP virtualization must be enabled and the virtualization must be “Per session”. This is done differently for the server versions; please refer to Microsoft documentation for specific instructions.

On the Windows Server, install the Vision Student module. For details on the installation process, see the [Netop Vision Quick Installation Guide](#).

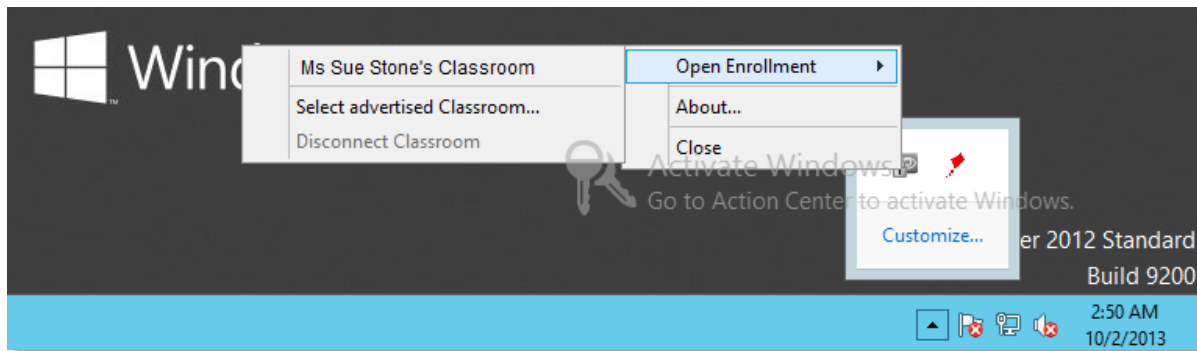

\*Vision Teacher does not work on Microsoft Remote Desktop Services virtualized environment

## Give students access to Vision

To access the software on the server, students need a remote desktop connection viewer or tool.

- For students using a Windows computer this could be the **Remote Desktop Connection** which is included as part of the operating system.
- For students using a Mac computer this could be **Remote Desktop Connection for Mac**.
- For students using tablets a number of Remote Desktop Connection apps are available from App Store and Play Store respectively

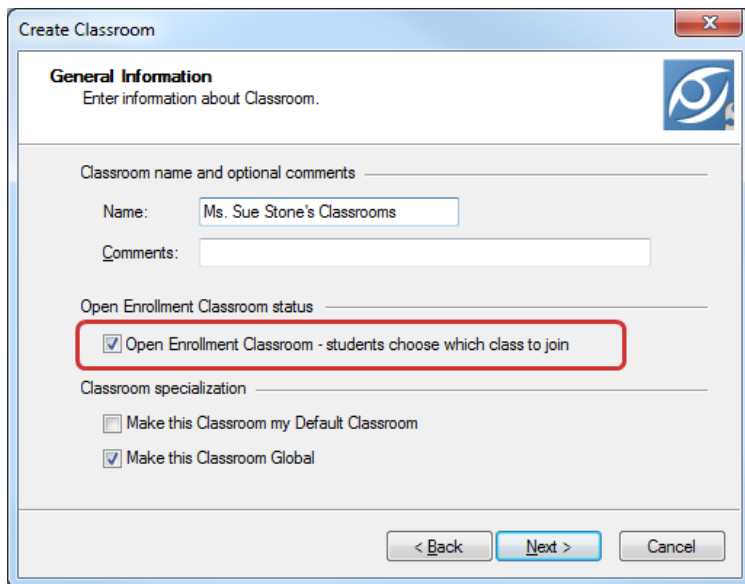

Once they have access to the remote desktop students can join a class that a teacher has already started from the open enrollment menu:

## Have teachers create and start a class

The Netop Vision teacher module must be installed on computer running Windows 8, Windows 7, or Vista.

The classroom must be defined as an **Open Enrollment Classroom**:

This means that students are presented with a list of available classrooms and they choose which one to join.

Students joining from a remote desktop can be mixed with students joining from other types of devices; below screenshot shows students joining from the Vision Student iPad app, from a Windows Server, from a Windows 7 computer and from a Windows 8 computer.

The functionality for teacher-student interaction when a student joins from a server is the same as for student joining from a Windows desktop or laptop.
